

Learning from social and environmental histories to build resilient solutions for disaster risk management

Monday 22 May, Cancun, Mexico

Featuring keynote speakers from the policy and academic communities, across the natural and social sciences and humanities, this workshop will ask:

- How can we develop more effective solutions for disaster risk management?
- How do social and economic pressures interact with ecosystem processes, environmental shocks and long-term stressors such as climate change?
- What can we learn from historical and cultural contexts to understand and build resilience?
- How can insights from history help to ensure that disaster risk management is sensitive to concerns of indigenous communities and women?
- How can we use history and culture as a lens to inform fairer solutions to disaster risk management?

The workshop will focus on Mesoamerica and the Caribbean, but the approaches have relevance for building resilience in other parts of the world.
